Energybenchmark

How is your site performing versus others?

Ploos has developed a web application in which energy bills serve as the basis for setting up energy management. Energy bills contain validated energy volumes and by coupling those to building-specific attributes, such as floor space in square metres, number of employees, patients, trainees, kilograms of milk etc. it creates indices per industry. The web application then shows per industry what the average consumption is and how your own site(s) are performing versus the average and, where applicable, versus one another. So subscribers can see at which location they need to start with energy saving and what the potential savings are.

Features

- Energy performance of sites versus one another
- Energy performance versus the industry average
- Dynamic indices per industry
- Take specific action
